Moving a record location in the iMapInvasives Mobile App

When creating a record in the iMapInvasives Mobile App, the location of the record defaults to the device’s current GPS location.

However, you can manually move the position of your record to a new location, either by tapping and dragging the point itself on the map, or by entering new geographic coordinates into the Location field.

To tap and drag the point on the map:
First, uncheck the GPS Box.

Next, tap the yellow point on the map, and it should turn into a purple circle.

![Image of map with yellow and purple points]

**Note:** If the yellow point does not turn into a purple circle, try tapping at the center of the yellow point icon. Sometimes this step takes a few tries.

Then, tap the purple dot and drag it across the map to the desired location.

Once the location is reached, simply tap anywhere on the map except the purple dot and the symbol should return to a yellow pin. The record location has now been updated, and the record is ready to be saved.

To enter new coordinates:
First, uncheck the GPS Box.

Next, enter new geographic coordinates in the **Location** field (in the format of WGS84 decimal degrees: Longitude, Latitude).
The record location has now been updated, and the record is ready to be saved.
